

# Answer Sheet

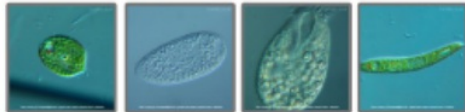

Insects: a small arthropod animal that has six legs.

Annelids: a segmented worm of the phylum Annelida.

Protozoa: single-celled microscopic animals.

Crustaceans: live mostly in water and have a hard shell, a segmented body, and jointed appendages.

Molluscs: soft unsegmented body and live in aquatic or damp habitats, and most kinds have an external calcareous shell.

Arachnids: joint-legged invertebrate with eight legs.

Echinoderm: marine invertebrate. Adults are recognizable by their (usually five-point) radial symmetry.
